

AI-CMS, Website Personalization & Attrib Case

Dr. Rahul Chavhan
Assistant Professor
School of Business Management
NMIMS, Mumbai

Where are we in the course?

Module I

Social networks

Who influences whom?
SNA, communities, centrality, influencers

Module II

Web analytics

What do users do?
Traffic, events, funnels, behaviour evidence

Module III

Online experience

What should we change?
CMS, AI personalization, UX, SEO, conversion

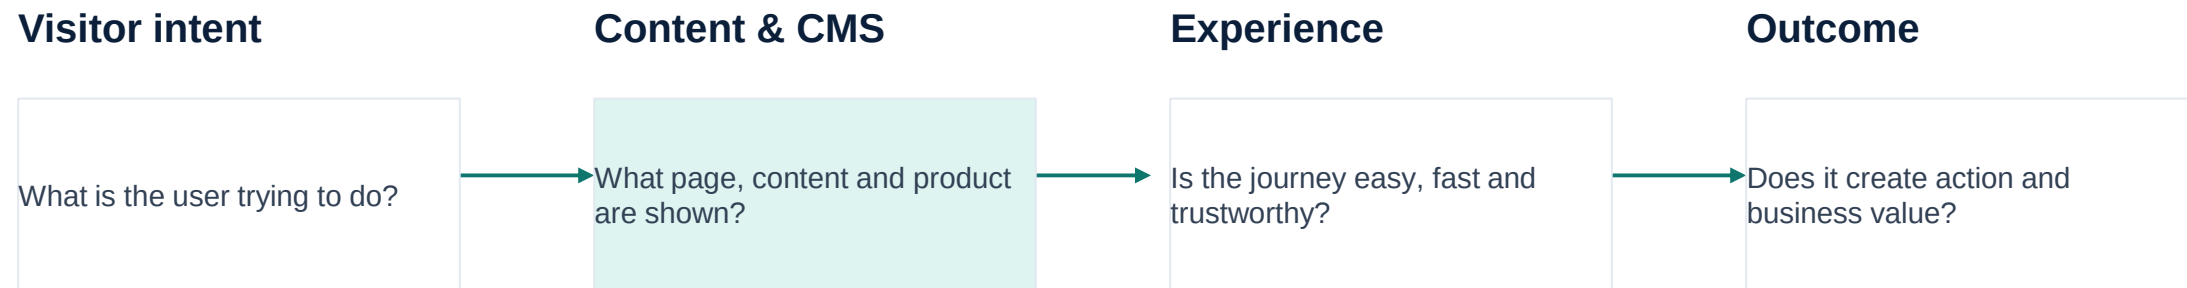

Module I and II tell us how the digital world behaves. Module III asks how managers design the digital environment to improve outcomes.

Learning bridge: analysis → design → business value

Module III big idea: the website is a conversion system

A website/app/platform is not only an information page; it is a **managed experience**.

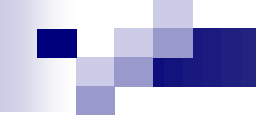

If two visitors have different needs, should they still see the same website?

What is a CMS?

CMS = the system that helps a business manage what digital content is shown, to whom, where, when and under what rules.

Design constraints

A digital experience fails when business, design and technical constraints are not aligned.

Responsive design

Works across mobile, tablet, desktop

Speed

Slow pages increase drop-offs and cost

Cross-browser

Experience must not break on Chrome/Safari/Edge

Accessibility

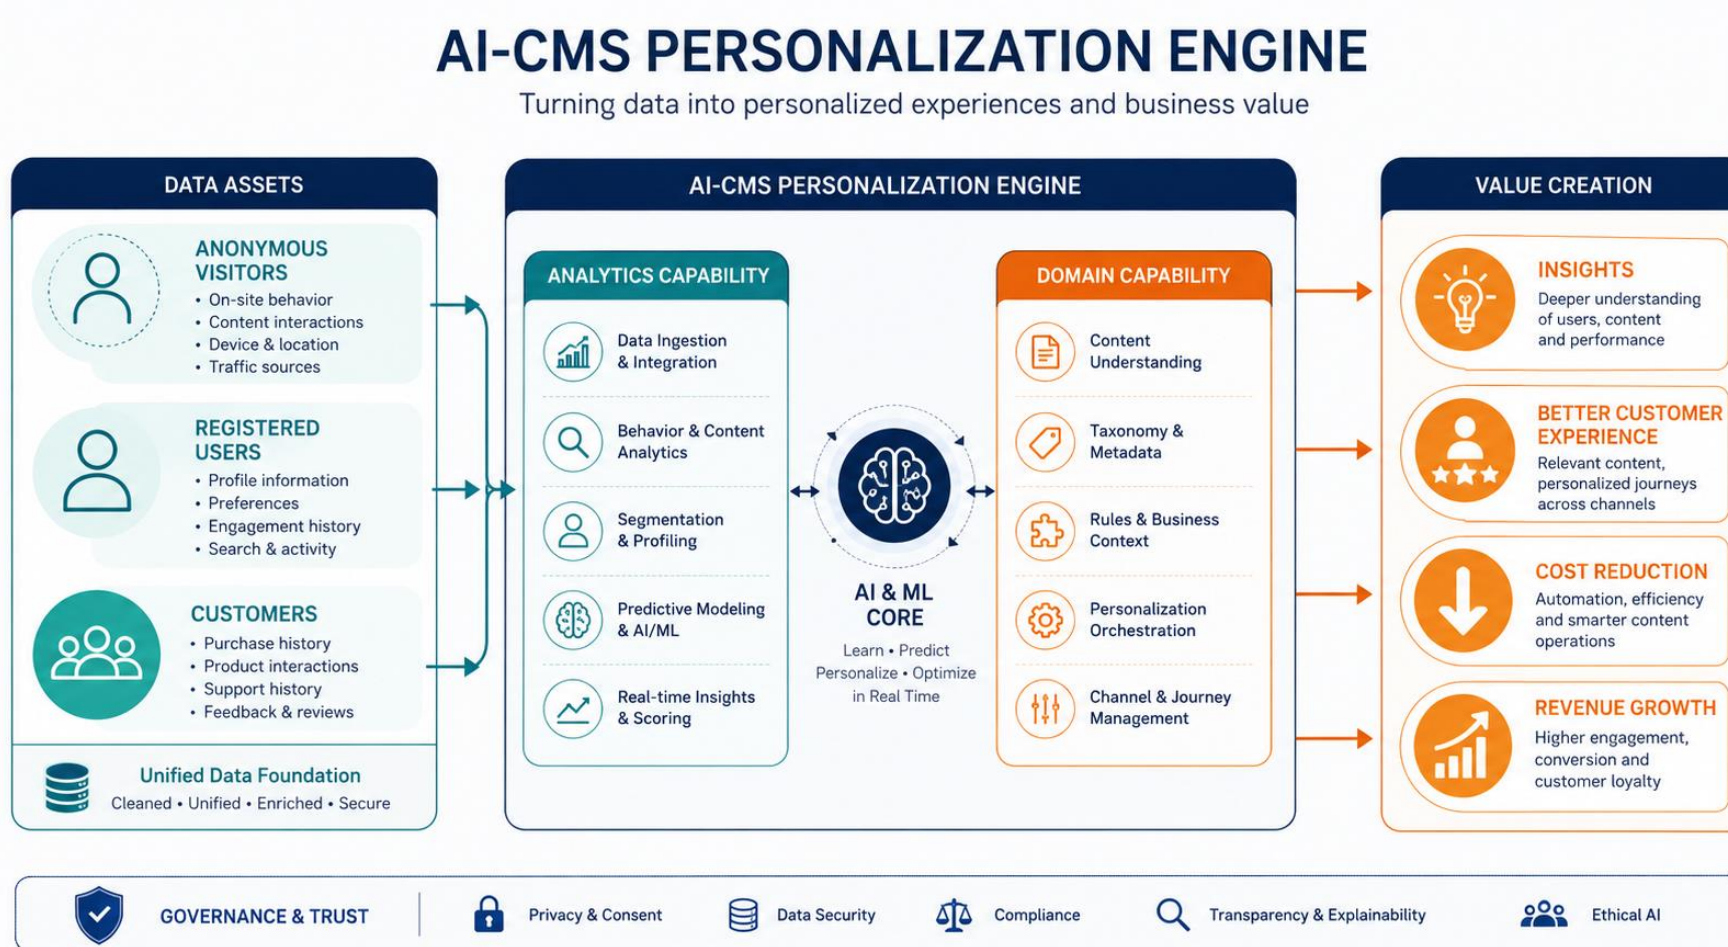

Usable by people with different abilities

Security

Protect users, content, data and transactions

From Web Analytics to AI-CMS

Module II measured behaviour; Module III uses behaviour to change the experience.

Right Content. Right Person. Right Time. Right Channel.

Analytics tells us what happened. AI-CMS decides what experience to show next.

Attryb case: the managerial problem

Founder Anil Bains has a technology solution, but clients need a business-value argument.

Company

Attryb, founded in 2021, Bangalore-based SaaS startup

Solution

AI-driven hyper-personalization stack for websites

Target clients

Small and medium D2C brands with limited technology strength

Pain point

High bounce rate, high acquisition cost, weak direct relationships

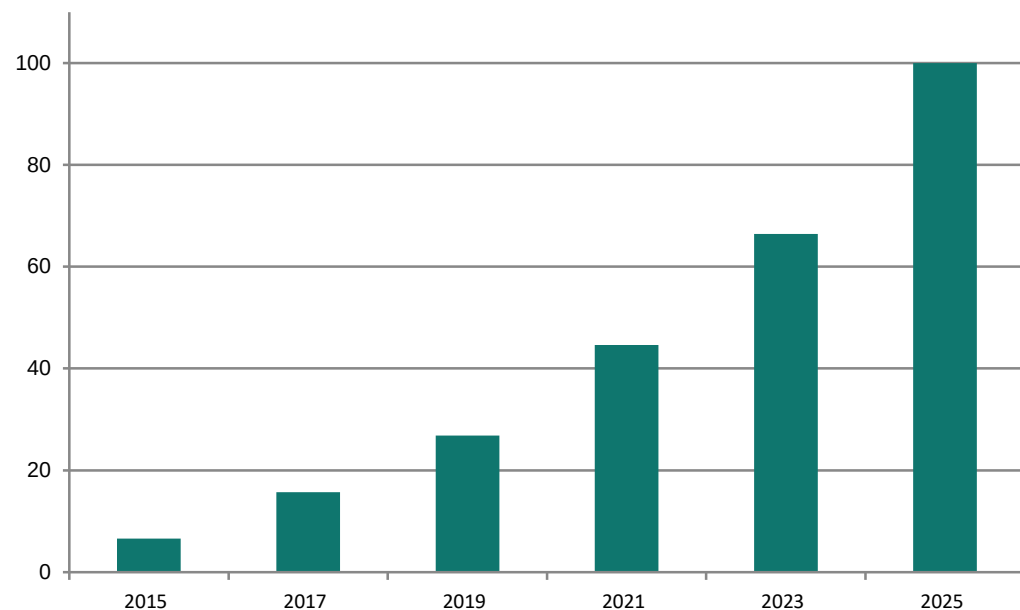

Decision problem

How to demonstrate economic value without overwhelming clients technically

Why this opportunity exists

D2C brands want Amazon-like personalization without Amazon-like internal resources.

India D2C market size (US\$ bn)

Personalization players

Dynamic Yield, Evergage, Certona

Performance testing

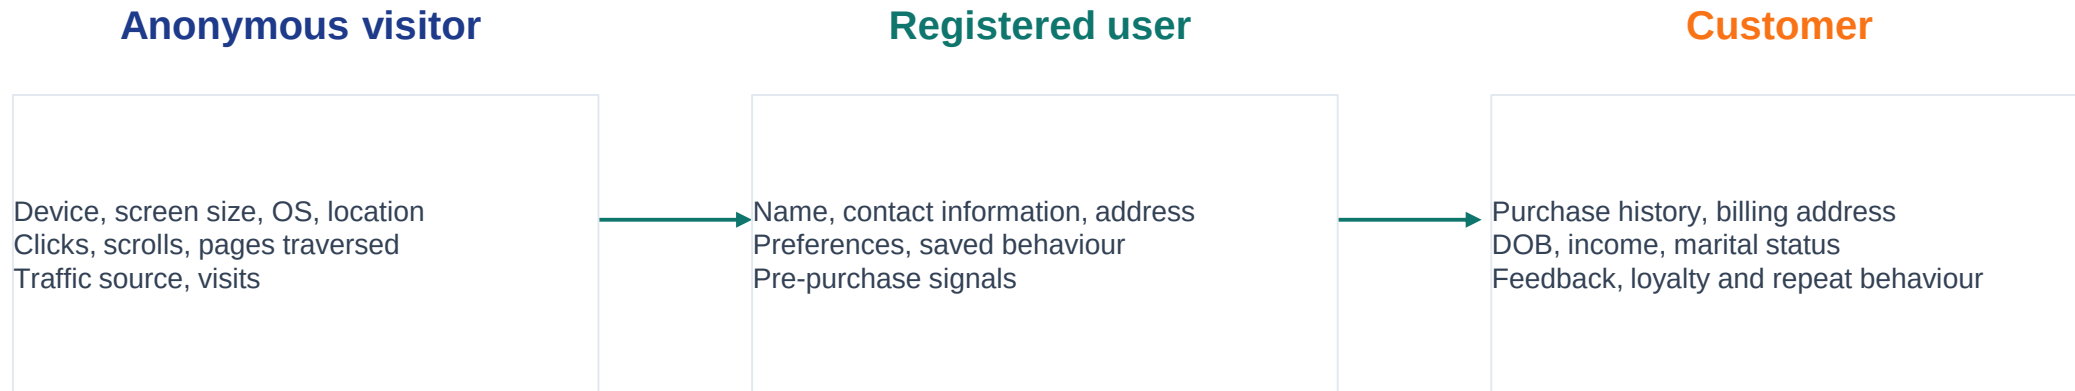

Optimizely, VWO, Heap

AI content generators

Jarvis, Writesonic, Article Forge

What data can AI-CMS use?

Attrib's logic depends on richer signals as the visitor relationship deepens.

Privacy lens

More data can improve personalization, but it also increases consent, compliance, security and trust responsibilities.

SciField case data: how segmentation drives routing

The AI engine creates segments; the business decides what experience each segment should receive.

Segment	Share	Likely intent	Routing logic
New: Discount Seeker	9.0%	Low risk, price sensitive	Mostly Cat 3
New: High Order Value	5.5%	May spend, needs fit	Mostly Cat 2
New: Others	70.5%	Unknown behaviour	Balanced across categories
Repeat: Discount Seeker	3.0%	Price sensitive but familiar	Mostly Cat 3
Repeat: HOV	10.5%	Premium-ready loyal customer	Mostly Cat 2
Repeat: Others	1.5%	Limited signal	Balanced across categories

Segmentation alone does not create value. Value is created when the segment is matched to the right content/product category.

Value calculator: the four metrics

This is the bridge from technical personalization to managerial ROI.

Conversion Rate (CVR)

$$\text{Orders} \div \text{Sessions}$$

Average Order Value (AOV)

$$\text{Total revenue} \div \text{Total orders}$$

Category Revenue

$$\text{Orders in category} \times \text{Category AOV}$$

Revenue Uplift

$$(\text{Personalized revenue} - \text{Baseline revenue}) \div \text{Baseline revenue}$$

Will personalization improve orders, revenue, AOV, or all three?

Segment	Sessions	Orders	CVR?
New DS	9,775	65	
New HOV	5,974	25	
New Others	76,574	360	
Repeat DS	3,258	22	
Repeat HOV	11,405	60	
Repeat	1,629	10	

Is the highest CVR automatically the most valuable segment?

Segment	CVR	Interpretation
New DS	0.67%	low-risk / discount-led products help first action
New HOV	0.42%	premium interest but new friction
New Others	0.47%	large volume, unclear
Repeat DS	0.68%	highest CVR but lower-order logic
Repeat HOV	0.53%	premium segment with better trust
Repeat Others	0.59%	small base; treat cautiously

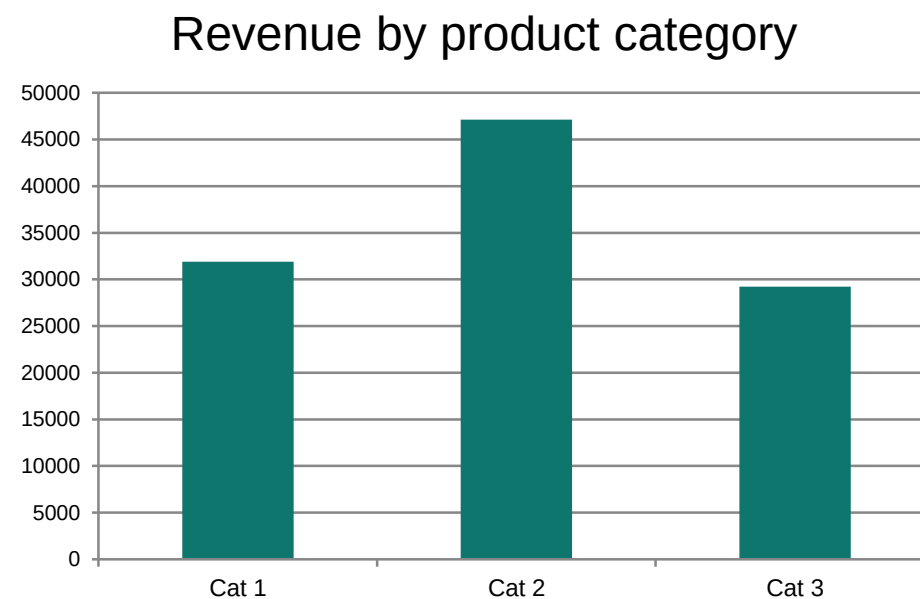

Conversion must be read with AOV and profitability.

Post-implementation: segment-based traffic routing

Attrib's personalization routes segments to product categories and changes the economics.

Category	Orders	AOV	Revenue
Cat 1	160	\$199	?
Cat 2	190	\$248	?
Cat 3	192	\$152	?
Total	543	\$199.50	?

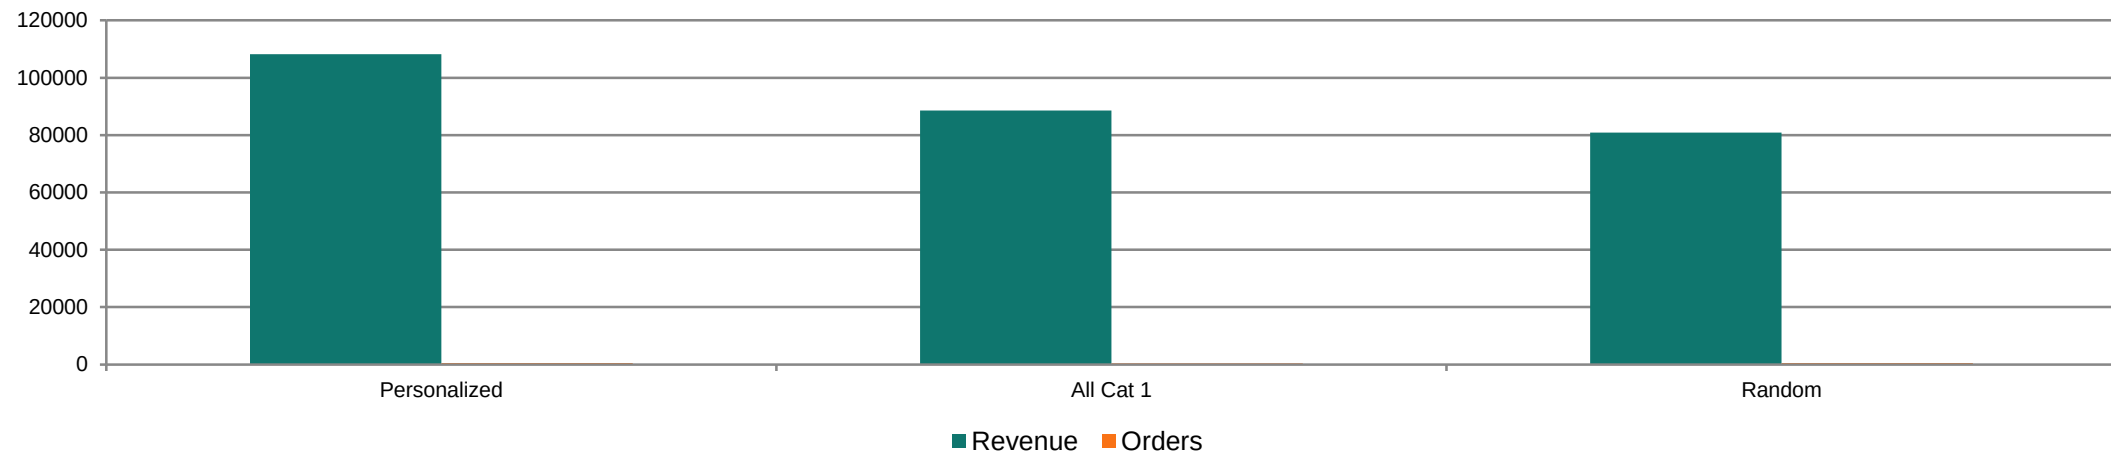

Cat 2 has the highest AOV and contributes the largest revenue because the routing strategy directs high-order-value segments toward it.

Does personalization create measurable value?

Compare personalized routing with two non-personalized baselines.

Scenario	Orders	Revenue
Post: personalized routing	543	?
Pre: all traffic to Cat 1	445	\$88,555
Pre: random routing	459	?

Recommended managerial decision

Do not sell “AI” first. Sell measurable business outcomes: revenue uplift, conversion improvement, AOV improvement, and lower wasted traffic.

Three things to remember

1

CMS is infrastructure

It manages content, workflows, channels, governance and experience delivery.

2

Personalization is matching

The right visitor should see the right content/product at the right time.

3

AI must prove value

The business case needs CVR, AOV, revenue, profit and risk measurement.
