

UI/UX

Dr. Rahul Chavhan
Assistant Professor
School of Business Management
NMIMS, Mumbai

Step 1: Start with the business problem

UrbanLoop is a D2C website for smart lifestyle products.

Business objective

Increase online sales of lifestyle products.

User objective

Solve a specific need with minimum confusion.

Website success

Connect the business goal with the user goal.

Step 2: Who are we building for?

Persona keeps the design anchored to a real user context.

AARAV — persona

29 years old
Working professional
Mostly shops on mobile
Needs a laptop backpack
Budget: under ₹2,500
Needs delivery before Monday
Does not want to compare 100 products

Persona = a simplified representation of a target user's needs, goals, behaviour and context.

Step 3: Convert persona into a user story

The user story becomes a design requirement.

As a working professional, I want to find a professional laptop backpack below ₹2,500 that fits my laptop and can arrive before Monday.

Who?

Aarav, working professional

What?

Find backpack under ₹2,500

Why?

Office use + delivery deadline

Constraint

Fits 15.6-inch laptop + before Monday

Designing screens without a user story creates attractive but directionless design.

Step 4: Map Aarav' s journey

A journey map makes the invisible experience visible.

	Discover	Search	Evaluate	Buy	Receive
Aarav does	Sees ad	Searches bag	Compares options	Pays	Tracks order
Thinks	Looks useful	Need fit + price	Will it last?	Is payment safe?	Will it arrive?
Feels	😊	😞	😞	😞	😊
Pain point	—	Too many items	Fit unclear	Charges late	No updates
Opportunity	Clear promise	Better filters	Size fit + reviews	Show total early	Proactive tracking

Journey map = actions + thoughts + emotions + pain points + opportunities.

Touchpoints, pain points and moments of truth

Use the journey map to identify where design matters most.

Touchpoint

Any interaction between user and business.
Example: search box, product page, cart.

Pain point

Anything that creates difficulty or uncertainty.
Example: fit information is unclear.

Moment of truth

A critical point that can change the buying decision.
Example: delivery date and payment trust.

Not every step is equally important. Some steps decide whether Aarav continues or leaves.

Step 5: Decide the website structure

Information architecture comes before visual design.

Weak structure

UrbanLoop
→ Work Essentials
→ Travel
→ Accessories
→ Laptop Bags

Better structure

UrbanLoop
→ Home
→ Shop
→ Bags
→ Laptop Bags
→ Bottles
→ Electronics
→ Cart
→ Help / Returns

Concept

Information Architecture =
organising information so users
can find what they need.

**Beautiful UI cannot fix a badly
structured website.**

Step 6: Build the homepage wireframe

No colors. No final images. Only structure.

Wireframe

A low-detail layout showing structure and function.

Why am I not choosing colors yet?

Because structure comes before style.

Step 7: Product-page wireframe

The product page must answer Aarav's decision questions.

Fit

Will this fit my laptop?

Price

Is it within budget?

Trust

What do buyers say?

Delivery

Will it arrive before Monday?

Risk

Can I return it?

What did the wireframe teach?

A wireframe is the website before decoration.

Structure

Where each section sits

Hierarchy

What appears first

Navigation

How users move

Function

What actions are possible

Decision cues

What information reduces uncertainty

Wireframe = architectural floor plan of the website.

Step 8: Explain UX on the wireframe

Ask one question: can Aarav achieve his goal easily?

Useful

Usable

Clear

Efficient

Trustworthy

Bad UX

Aarav cannot find search, cannot understand delivery, and is unsure what happened after click.

Good UX

The website helps Aarav complete the task with low confusion and high confidence.

Visibility

Important actions must be discoverable.

Hidden search somewhere in menu

 **Search backpacks, bottles, chargers...**

Affordance

A control should look usable.

Add to cart?

Add to cart

Feedback

The system should confirm an action.

Add to cart

✓ Added to cart • Cart 0 → 1

Mental model

Use familiar patterns.

 Search  Cart  Wishlist

Users already know these conventions.

Consistency

Same action, same label and behavior.

Add to cart

Use this label everywhere, not "Get it", "Purchase" and "Add".

Trust & usability

Answer critical questions before checkout.

Fits 15.6" laptop
Delivery by Sunday
7-day easy return

Step 9: Turn the wireframe into a prototype

Wireframe answers "what goes where." Prototype answers "what happens when I click?"

Prototype = a simulation of the experience before expensive development.

Step 10: Now design the UI

The experience works. Now we decide how it should look and communicate.

UX asks

Can Aarav find the right backpack, understand fit, trust delivery and complete checkout?

UI asks

Are buttons clear, text readable, spacing comfortable, images useful and actions obvious?

Step 11: Apply visual hierarchy

Guide the eye: image → price → proof → action.

Visual hierarchy tells users what matters first, second and next.

Step 12: Make the CTA specific

The most expensive button on the page should not be vague.

Weak CTA

“Continue”

Problem: What happens when I click?

Continue

Strong CTA

“Add to Cart” / “Proceed to Checkout”

Benefit: clear action + clear expectation

ADD TO CART

Step 13: Add decision-supporting content

Weak content

Premium Laptop Backpack
Good material.
Modern look.
Buy now.

Better content

Fits laptops up to 15.6 inches
Water-resistant outer material
₹2,199 | Delivery by Sunday
7-day easy return
4.5 ★ from 1,240 buyers
Two compartments + office organizer pocket

Content answers the questions already running in the user's mind.

Step 14: Fix microcopy

Poor microcopy

ERROR 417
Invalid input
Submit

Good microcopy

Payment failed. No amount was
deducted.
Enter a 10-digit mobile number.
Place Order

Microcopy = small interface text that guides, explains, reassures or prevents mistakes.

Step 15: Make it responsive

Desktop

Mobile

If most customers come from mobile and mobile experience is poor, it is a business problem.

Step 16: Scale with CMS

What happens when UrbanLoop has 5,000 products?

Without CMS

Create every product page manually.
Update price manually.
Risk inconsistent content.
Slow changes.

With CMS

One product template + structured content fields:

Product name | Price | Image | Category | Stock | Delivery |
Description

CMS lets teams manage content at scale without redesigning every page.

Step 17: Add personalization

Aarav viewed

Laptop backpacks
Office organizers
Wireless chargers

Next visit homepage

Continue exploring work backpacks
Recommended: office-ready accessories
Offer: laptop bag + organizer bundle

Personalization = right content → right user → right context.

Step 18: Publish the website

Step 19: Usability testing

Watch the user. Do not help the user.

PLAY **Usability testing demo**
Give a realistic task. Observe silently. Record friction.

Observer notes
Size option is missed
Evidence: delay / wrong click / question

Task
Find a red dress under ₹3000 and add size M to cart.

Task

Buy a laptop backpack under ₹2,500.

Measure

Task success
Time on task
Errors
Hesitations
Satisfaction

Usability testing = observing representative users attempting realistic tasks.

Step 20: Heatmaps and session recordings

Users tell us things without speaking.

Heatmap

Where users click, tap, scroll or look.

Session recording

How an individual user journey unfolds: loops, hesitation, repeated clicks.

Managerial use

Find friction before it becomes churn.

Step 22: A/B testing

Two versions enter. Data decides.

Version A

₹2,199

ADD TO CART

Cart rate: 4.8%

Version B

₹2,199

Delivery by Sunday

ADD TO CART

Cart rate: 6.1%

The website is never “finished”

Digital experience is a continuous optimization loop.

Observe → understand → design → build → test → measure → improve again.

Final recap: the website-building logic
